

Description

The Emergency Fastening Device (EFD) operates at the same time with the Seat Belt Pretensioner when the deployment condition is satisfied in the event of a collision.

It is an auxiliary equipment that instantly pulls the seat belts toward the anchor in the event of frontal collision to protect the driver and front passenger from breaking away.

It is located near the anchor on the driver and passenger seat and is supported by two cables.

⚠ CAUTION

Never measure the resistance of the anchor pretensioner directly, the current of the measuring device may cause unexpected airbag deploy.
